## Evaluation Board Manual

### Single Channel LiDAR EVB

## CAUTION

Please carefully read the following content since it contains critical information about safety and the possible hazard it may cause by

### ELECTRICAL SHOCK HAZARD

There is a dangerous voltage on the demo board, and exposure to high voltage may lead to safety problems such as injury or death.

Proper operating and safety procedures must be adhered to and used only for laboratory evaluation demonstrations and not directly to end-user equipment.

### HOT SURFACE

The surface of PCB can be hot and could cause burns. DO NOT TOUCH THE PCB WHILE OPERATING!!

### REMINDER

This product contains parts that are susceptible to electrostatic discharge (ESD). When using this product, be sure to follow antistatic procedures.

## 1. Overview

### 1.1. Introduction

INNELD050A1 is a LiDAR evaluation board for generating narrow pulse width (< 2 ns) high current pulses ( $\leq 50$  A) to drive laser diodes. The board uses INN100W08 Enhanced Mode (E-Mode) FET, and INNELD050A1 integrates one GaN devices. For more detailed information about the devices, please visit the Innoscience official website. The INNELD050A1 LiDAR EVB evaluation board adjusts the peak value of the output pulse current by changing the main power supply voltage and adjusts the pulse width of the output pulse current by changing the pulse generated by the signal generator. The measurement interface uses an Oscilloscope voltage probe( $\geq 1\text{GHz}$ ) which can realize the measurement of sub-ns waveform, which perfectly demonstrates the ultra-fast switching capability of GaN HEMT, INNELD050A1. The commutator switching transient is <1 ns.

### 1.2. Test Equipment Requirement

To evaluate the performance properly, you need to prepare the following test equipment:

- 1) MSO54-2GHz-4CH oscilloscope; (bandwidth $>1\text{GHz}$ )
- 2) AFG31000 signal generator; (minimum pulse width $\leq 20\text{ns}$ )
- 3) Keithley 2231A-30-3 power supply; (maximum output voltage  $\geq 12\text{V}$ )
- 4) IT6513 power supply; (maximum output voltage  $\geq 40\text{V}$ )
- 5) 1GHz 300V CATII Probe; (impedance  $1\text{M}\Omega$ )

## 2. Parameters

Table 1 Electrical Characteristic (Ta=25°C)

Symbol	Parameters	Min	Nom	Max	Units
Vaux	Auxiliary input voltage	5.5	8	15	V
Vbus	Bus input voltage	0	30	40	V
I <sub>o</sub>	output load current			50	A
Z <sub>in</sub>	Input impedance		1M		Ω
V <sub>signal</sub>	Input pulse voltage	0		5	V
F <sub>signal</sub>	Input pulse frequency	0		150	MHz
T <sub>signal</sub>	Input pulse width	20		1000	ns

### 3. Block Diagram

The schematic diagram of INNELD050A1 evaluation board is shown in Figure 1. The Pulse input from the signal generator output is passed to the driver. When the input pulse becomes high, the driver opens the INN100W08 and capacitor C1 discharges through the laser diode D1. When the input pulse becomes low, Q1 turns off.

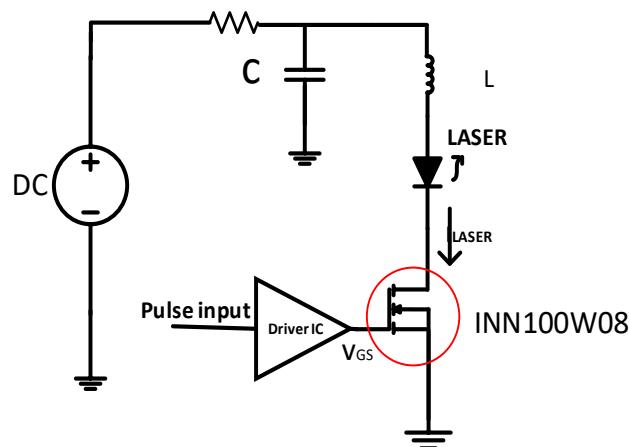

Figure 1 Schematic of LiDAR Application

## 4. PCBA Overview and Schematic

### 4.1. PCBA Overview

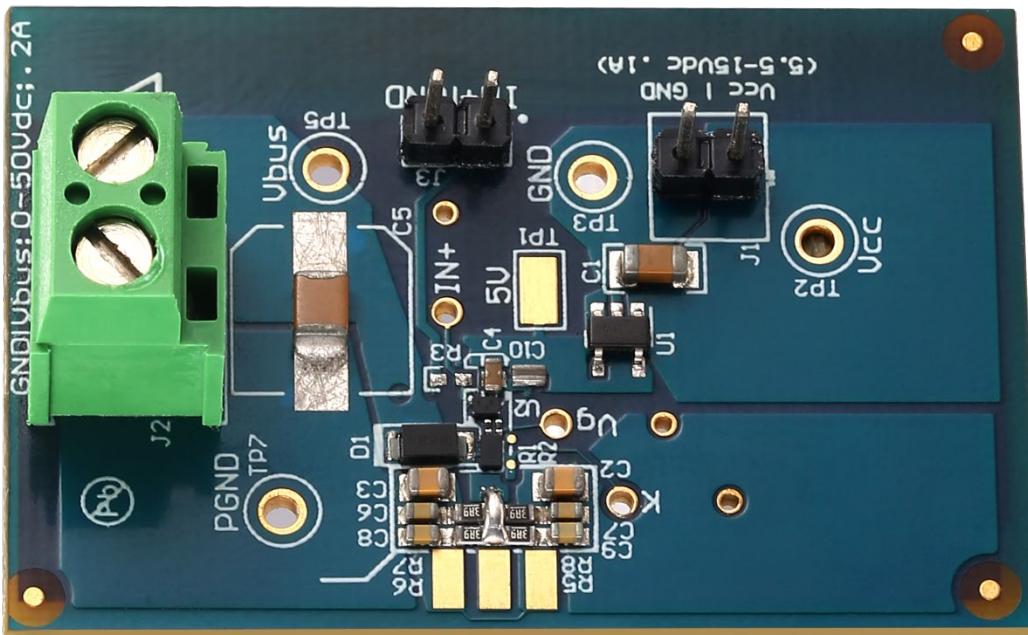

Figure 2 Top view of INNELD050A1

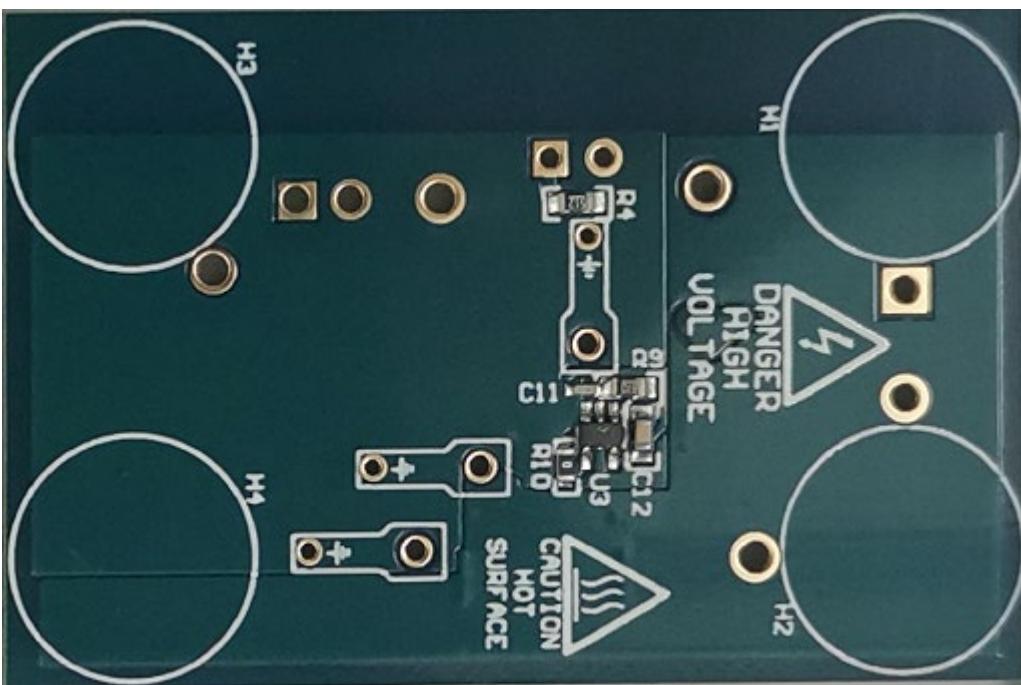

Figure 3 Bottom view of INNELD050A1

## 4.2. Schematic

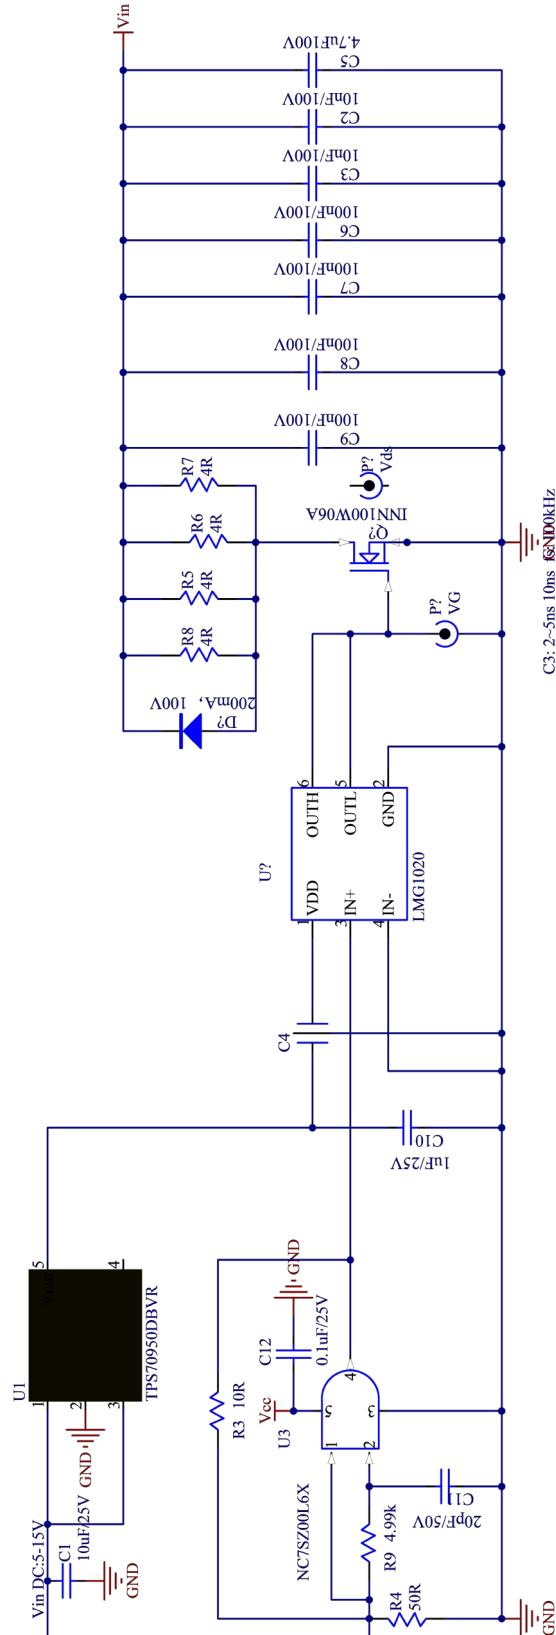

Figure 4 Schematic

## 5. Testing Guide

### 5.1. Test setup

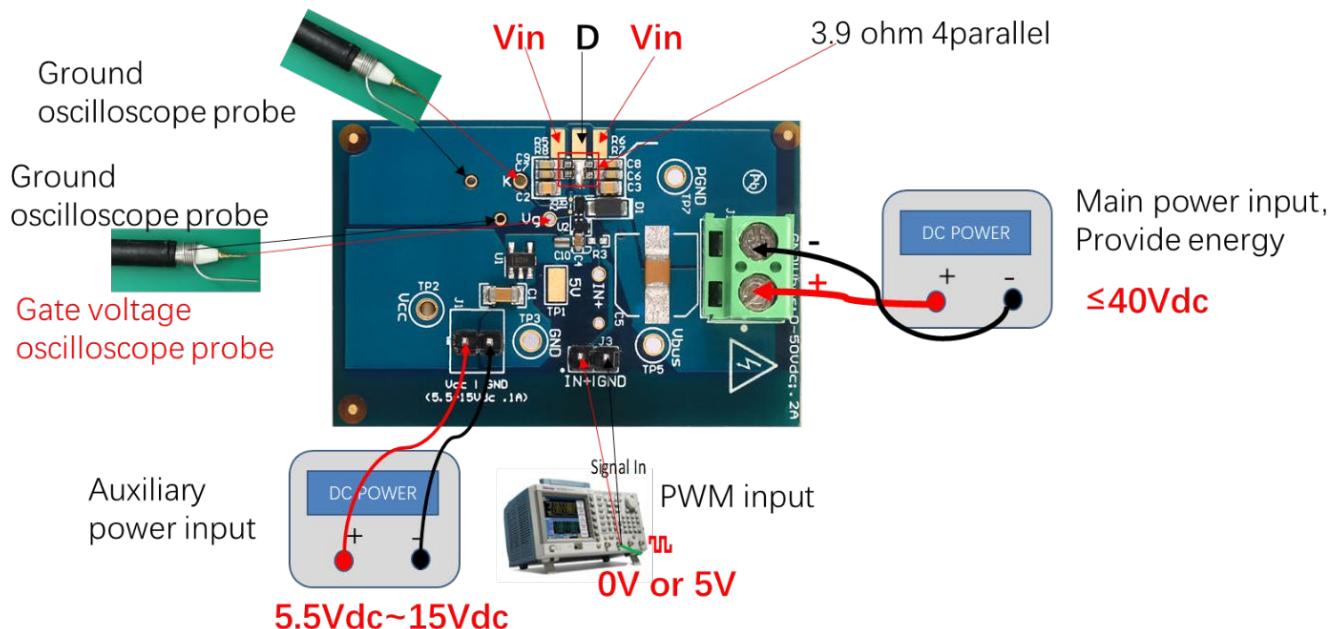

Figure 5 Measurement points

### 5.2. Power up and down sequence

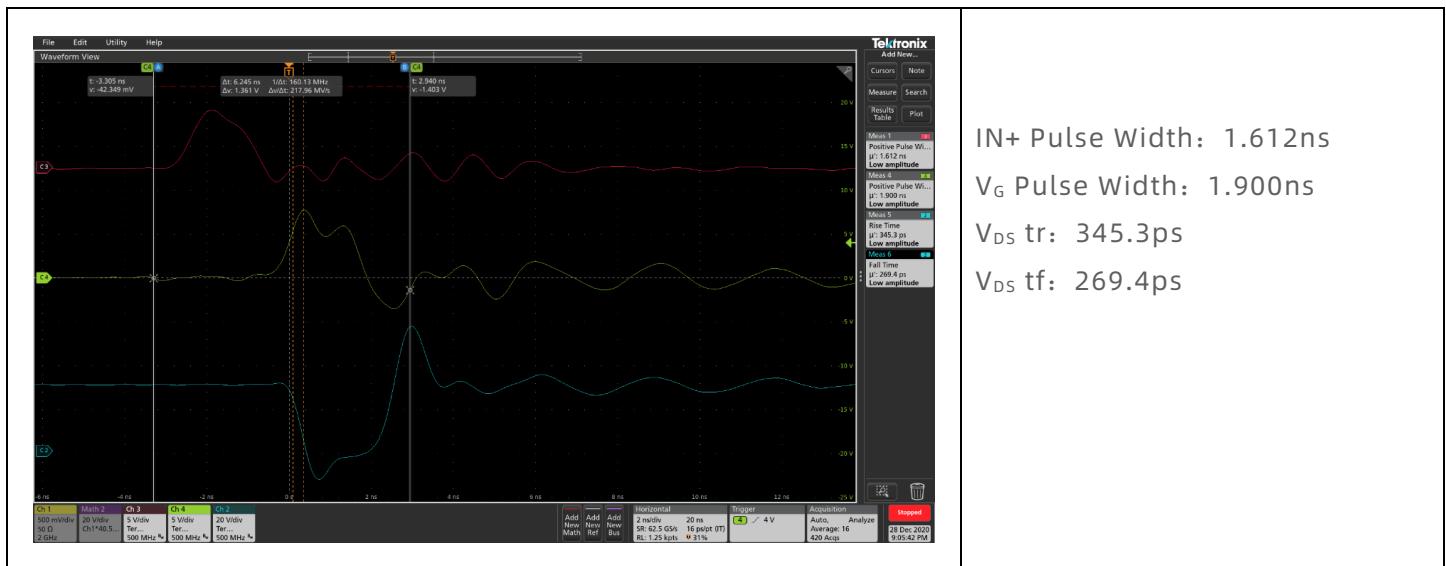

#### Power on:

1. Auxiliary power input: 8Vdc. Current limit is greater than 0.5A.
2. PWM input: Frequency 100kHz, High:5V ,Low:0V, Width: 5ns (2ns to 20ns).
3. Main power input: 30Vdc. Current limit is greater than 10A

#### Power off:

1. PWM input off.
2. Main power input off.
3. Auxiliary power input off.
